1 Bandit

1.1 Levels

1.1.1 bandit0

Password to enter: bandit0

Challenge: Solved using the ssh command, which included use of flags to set

user & port.

ssh bandit0@bandit.labs.overthewire.org -p 2220

1.1.2 bandit1

Password to enter: boJ9jbbUNNfktd78OOpsqOltutMc3MY1

Challenge: Reading a file named '-', this was problematic due to many common shell commands using '-' to prefix an option or flag.

cat ./-

1.1.3 bandit2

Password to enter: CV1DtqXWVFXTvM2F0k09SHz0YwRINYA9

Challenge: With spaces in a filename, shell programs will interpret the input as several arguments (instead of one space-delimited string). This issue can be solved two ways.

cat 'spaced filename'

cat spaced\ filename

1.1.4 bandit3

Password to enter: UmHadQclWmgdLOKQ3YNgjWxGoRMb5luK

Challenge: The file is prepended by a '.', which causes it to be hidden from most views. The -A flag for ls will show all hidden files except '.' & '..', which are part of the directory itself.

ls -A1

1.1.5 bandit4

Password to enter: pIwrPrtPN36QITSp3EQaw936yaFoFqAB

Challenge: The file is hidden in one of '/inhere/-file0,9'. They contain special characters that interfere with the terminal environment. The use of **less** aids, as it prompts before reading a binary file and provides somewhat of a sandbox to prevent the tty from being broken.

less
$$./-file0[0-9]$$

Note: use :n when inside less to go the next file

1.1.6 bandit5

Password to enter: koReBOKuIDDepwhWk7jZC0RTdopnAYKh

Challenge: The file is within one of many sub-folders, with human readable encoding and a file size of '1033' bytes. The use of **ls** with the recursive flag -R, combined with **grep** to select the file with the given size solves this problem.

1.1.7 bandit6

Password to enter: DXjZPULLxYr17uwoI01bNLQbtFemEgo7

Challenge: The file is somewhere on the server, so we should search recursively from the root of the drive. We are given the owner name, group name and size of the file, which we can plug into find to find the file.

```
find / -group bandit6 -size 33c 2>&1 | grep -v "
Permission denied"
```

Note: The use of a terminal redirect and grep remove the output of excessive file permission warnings

1.1.8 bandit7

Password to enter: HKBPTKQnIay4Fw76bEy8PVxKEDQRKTzs Challenge: This level is a simple grep search for the word millionth in a large

keyword text file.

1.1.9 bandit8

Password to enter: cvX2JJa4CFALtqS87jk27qwqGhBM9plV

Challenge: The password is the only line that occurs once within an unordered text file.

```
sort data.txt | uniq -u
```

Note: The -u flag of uniq ensures only lines of 1 occurrence are printed

1.1.10 bandit9

Password to enter: UsvVyFSfZZWbi6wgC7dAFyFuR6jQQUhR

Challenge: The given file is a binary encoded file, IE. it is not in plaintext or easy to read. **strings** will only print human-readable strings from a given input, and the use of **grep** will limit the output to a manageable size.

```
strings data.txt | grep -Ee [=]+
```

1.1.11 bandit10

Password to enter: truKLdjsbJ5g7yyJ2X2R0o3a5HQJFuLk

Challenge: The file is encoded in base 64, which can be encoded and decoded using the base64 program.

base64 -d data.txt

1.1.12 bandit11

 $\textbf{Password to enter:} \ \textit{IFukwKGsFW8MOq3IRFqrxE1hxTNEbUPR}$

Challenge: The file is encoded in a ROT-13 cipher, meaning that all letters in the alphabet have been shifted 13 places. **tr** is a unix program which is used the **tr**anslate various sets of text.

cat data.txt | tr "n-za-mN-ZA-M" "a-zA-Z"

1.1.13 bandit 12

 $\textbf{Password to enter:} \ 5\textit{Te8Y4} drg \textit{CRfCx8} ugdwu \textit{EX8KFC6} k2 \textit{EUu}$

Challenge:

1.1.14 bandit14

Password to enter:

Challenge:

1.1.15 bandit14

Password to enter:

Challenge:
